

**MAT1830 - Discrete Mathematics for Computer Science**  
**Tutorial Sheet #11 and Additional Practice Questions**

**Tutorial Questions**

**simple graph  $\Rightarrow$  1 vertex between 2 vertices**

1. For each of the graphs described below, either give an example of such a graph or explain why it does not exist. **Sum of degrees must be even num**

- A simple graph with 7 vertices with degrees 8, 5, 4, 4, 3, 1, 1.  $8+5+4+4+3+1+1 = 26$
- A simple graph with 8 vertices with degrees 4, 4, 4, 4, 4, 2, 2, 2.  $4+4+4+4+4+2+2+2 = 26$
- A simple graph with 6 vertices with degrees 3, 3, 2, 2, 1, 1 that is a tree.  $3+3+2+2+1+1 = 12$
- A simple graph with 8 vertices with degrees 3, 3, 2, 2, 1, 1, 1, 1 that is a tree.  $3+3+2+2+1+1+1+1 = 16$
- A simple graph with 6 vertices with degrees 4, 4, 3, 3, 2, 1.  $4+4+3+3+2+1 = 17$   $= 14$

2. **\* tree don't have cycles**

- \* Find a spanning tree of  $X$  that contains neither the edge  $JL$  nor the edge  $KH$ , or explain why one does not exist.
  - \* Find a spanning tree of  $X$  that contains neither the edge  $DL$  nor the edge  $KH$ , or explain why one does not exist.
  - \* How many different spanning trees of  $X$  are there that contain no edge in  $\{DE, FH, FL, HL\}$ ? **closed Euler trail**  $\leftarrow$  **start at D, ends at D**
3. (a) Apply the algorithm given in lectures to find an Euler trail in the graph  $X$ .  
(b) Apply the algorithm given in lectures to find a minimum weight spanning tree in the weighted graph  $Y$ .
4. \* Does every simple graph with 8 vertices and 11 edges have a spanning tree? If so, prove it. If not, give an example of a graph with 8 vertices and 11 edges with no spanning tree.  
\* If a simple graph with 8 vertices and 11 edges does have a spanning tree, how many edges will the spanning tree have?
5. \* Use the breadth first algorithm given in lectures to find a spanning tree in the graph  $X$  from question 2.  
\* Use the depth first algorithm given in lectures to find a spanning tree in the graph  $X$  from question 2.

[Note: In (a) and (b), where the algorithms allow a choice of which vertex to add to a queue or stack, choose the vertex earliest in the alphabet. In particular,  $A$  should be chosen as the root in both (a) and (b).]

(See over for practice questions.)

## Practice Questions

- \*1. A new phone company has built exchanges in Blackburn, Clayton, Frankston, Thornbury, Sunshine and Richmond and wants to connect them up with fibre optic cable as cheaply as possible. They do not care how the exchanges are connected provided that every exchange can be reached from every other exchange (possibly via other exchanges). They have done a cost analysis for laying cable between pairs of exchanges and the results are as follows.

	Blackburn	Clayton	Frankston	Thornbury	Sunshine	Richmond
Blackburn	-	\$1.2M	\$3.3M	\$2.4M	\$3.0M	\$1.1M
Clayton	-	-	\$2.8M	\$2.1M	\$3.1M	\$1.3M
Frankston	-	-	-	\$4.1M	\$5.1M	\$3.2M
Thornbury	-	-	-	-	\$3.1M	\$1.5M
Sunshine	-	-	-	-	-	\$2.7M
Richmond	-	-	-	-	-	-

How cheaply can they do it?

2. There are 21 people at a party. Some of them have met before and others have not. Omar offers to buy everyone at the party dinner if it turns out that everyone there has previously met an odd number of the other guests. Is he taking a risk? *himself in the party.*

3. Is it always possible to find a closed walk in a simple connected graph  $G$  that uses every edge exactly twice? Explain why or why not.

*yes, since it's a connected graph, it can start and end at the same vertex.*

4. Suppose you are given a connected graph  $G$  and you wish to find a path between two vertices  $A$  and  $B$  in  $G$

\*a) How could you use a spanning tree (or part of one) to accomplish this.

\*b) Suppose you wanted to find a path that was definitely one of the shortest paths between  $A$  and  $B$ . Would you use a depth-first or breadth-first algorithm to find the spanning tree? Why?

## 1) simple graph

(a) 7 vertices, degrees 8544311

does not exist, can't have 8 degrees with only 7 vertices

(c) 6 vertices, degrees 332211, tree

(e) 6 vertices, degrees 443321

(b) 8 vertices, degrees 44444222

(d) 8 vertices, degree 33221111, tree
