#### Matrix Inverse 2.5

Suppose we have a system of equations

$$\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] \left[\begin{array}{c} x \\ y \end{array}\right] = \left[\begin{array}{c} u \\ v \end{array}\right]$$

and that we write in the matrix form

$$X = \frac{B}{A}$$
 (Algebra)

Can we find another matrix, call it  $A^{-1}$ , such that

$$2 \times 2^{-1} : 2 \times \frac{1}{2} = 1$$

$$I = (10)$$

 $A^{-1}A = I$  = the identity matrix

If so, then we have

$$A^{-1}AX = A^{-1}B$$
  $\Rightarrow$   $X = A^{-1}B$ 

Thus we have found the solution of the original system of equations.

For a  $2 \times 2$  matrix it is easy to verify that

rix it is easy to verify that 
$$A^{-1} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$
 det (A)

Note that not all matrices will have an inverse. For example, if

 $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \qquad - \qquad \text{The Given matrix } A$  Must square matrix  $A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & b \\ -c & a \end{bmatrix}$   $\text{Out(A) $\neq 0$}$ 

then

and for this to be possible we must have  $ad - bc \neq 0$ .

inverse

In later lectures we will see some different methods for computing the inverse  $A^{-1}$  for other (square) matrices larger than  $2 \times 2$ .

Properties of inverses
$$A^{-1} = \begin{pmatrix} 1 & 3 \\ 2 & 4 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 1 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} = \begin{pmatrix} -2 & 1 \\ 2 & -1 \end{pmatrix}$$

$$A^{-1} =$$

• A square matrix has at most one inverse. Proof: If  $B_1$  and  $B_2$  are both inverses of A, then  $AB_1 = B_1A = I$  and  $AB_2 = B_2A = I$ . So  $B_1 = B_1I = B_1(AB_2) = (B_1A)B_2 = IB_2 = B_2$ .

- If A is invertible, then so is  $A^T$  and  $(A^T)^{-1} = (A^{-1})^T$ .  $(A^{-1})^{-1} = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix} > A$
- If A is invertible, then so is  $A^{-1}$  and  $(A^{-1})^{-1} = A$ .

 $\bullet\,$  If A and B are invertible matrices of the same size, then AB is invertible and  $(AB)^{-1} = B^{-1}A^{-1}$ . (ABC) = C B A •  $(A_1A_2...A_m)^{-1} = A_m^{-1}...A_2^{-1}A_1^{-1}$ .

• If  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  and  $ad - bc \neq 0$ , then  $A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$ .

- -BAC = DAE does **not** imply BC = DE.
- Solving systems: Let A be  $n \times n$  and invertible. Then the linear system Ax = b always has exactly one solution, namely  $x = A^{-1}b$ .
- AAX = BA-1

 Rank test: An n × n matrix A is invertible if and only if it has full rank r = n.

#### 2.6Matrix Transpose

If A is a matrix of size  $m \times n$  then the **transpose**  $A^T$  of A is the  $n \times m$ matrix defined by  $A^{T}(j,i) = A(i,j)$ .

Consider the matrix  $A = \begin{bmatrix} 2 & 3 & 4 \\ 0 & 1 & 5 \end{bmatrix}$ . The transpose of A, namely  $A^T$  is simple to find. Row 1 of matrix A becomes column 1 of matrix  $A^T$ , and row

2 of matrix 
$$A$$
 becomes column 2 of matrix  $A^T$ . Thus  $A^T = \begin{bmatrix} 2 & 0 \\ 3 & 1 \\ 4 & 5 \end{bmatrix}$ .

**Example 2.14.** Let 
$$B = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 5 \end{bmatrix}$$
 and  $C = \begin{bmatrix} 1 & 1 & 1 & 0 & 0 \\ 0 & 1 & 2 & 1 & 0 \\ 2 & 0 & 1 & 1 & 0 \end{bmatrix}$ .

Find  $B^T$  and  $C^T$ .

$$\mathcal{B}^{7} = \begin{pmatrix} 1 & 1 \\ 1 & 2 \\ 1 & 5 \end{pmatrix} \qquad \mathcal{C}^{7} = \begin{pmatrix} 1 & 0 & 2 \\ 1 & 1 & 0 \\ 1 & 2 & 1 \\ 0 & 1 & 1 \end{pmatrix}$$

Note the following:

$$(A^T)^T = A$$

$$(cA)^T = cA^T$$

$$(AB)^T = B^T A^T$$

**Example 2.15.** Verify the above using matrices  $A = \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix}$  and  $B = \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix}$ 

Example 2.15. Verify the above using matrices 
$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$
.

(i)  $(A^{T})^{T} = \begin{pmatrix} 2 & 4 \\ 3 & 5 \end{pmatrix}^{T} = \begin{pmatrix} 2 & 3 \\ 4 & 5 \end{pmatrix} = A$ 

(i)  $(A^{T})^{T} = \begin{pmatrix} 2 & 4 \\ 3 & 5 \end{pmatrix}^{T} = \begin{pmatrix} 2 & 3 \\ 4 & 5 \end{pmatrix} = A$ 

(ii)  $(A^{T})^{T} = \begin{pmatrix} 2 & 4 \\ 3 & 5 \end{pmatrix}^{T} = \begin{pmatrix} 2 & 3 \\ 4 & 5 \end{pmatrix} = A$ 

(ii)  $(A^{T})^{T} = \begin{pmatrix} 2 & 4 \\ 3 & 5 \end{pmatrix}^{T} + \begin{pmatrix} 2 & 4 \\ 2 & 4 \end{pmatrix}^{T} = \begin{pmatrix} 2 & 3 \\ 2 & 4 \end{pmatrix}^{T} + \begin{pmatrix} 2 & 4 \\ 1 & 2 & 4 \end{pmatrix}^{T} = \begin{pmatrix} 11 & 16 \\ 19 & 28 \end{pmatrix}^{T}$

(iv)  $(A^{T})^{T} = \begin{pmatrix} 2 & 3 \\ 3 & 5 \end{pmatrix} = \begin{pmatrix} 4 & 8 \\ 6 & 10 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 2 & 3 \\ 3 & 5 \end{pmatrix} = \begin{pmatrix} 4 & 8 \\ 6 & 10 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 3 & 5 \end{pmatrix} = \begin{pmatrix} 4 & 8 \\ 6 & 10 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 6 & 10 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 6 & 10 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^{T} = \begin{pmatrix} 4 & 8 \\ 1 & 4 \end{pmatrix}$ 

(iv)  $(A^{T})^$ 

The determinant function  $\det$  is a function that assigns to each  $n \times n$  matrix A a number  $\det$  A called the  $\det$  A called the  $\det$  A. The function is defined as follows:

- If n = 1: A = [a] and we define det A := a.
- If n = 2:  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  and we define det A := ad bc.

• If n > 2: It gets a bit complicated now, but it is not too bad. Firstly create a sub-matrix  $S_{ij}$  of A by deleting the  $i^{th}$  row and the  $j^{th}$  column. Then define

$$\det A := a_{11} \det S_{11} - a_{12} \det S_{12} + a_{13} \det S_{13} - \dots \pm a_{1n} \det S_{1n}$$

The quantity det  $S_{ij}$  is called the minor of entry  $a_{ij}$  and is denoted  $M_{ij}$ . The number  $(-1)^{i+j}M_{ij}$  is called the cofactor of entry  $a_{ij}$ . Thus to compute det A you have to compute a chain of determinants from  $(n-1) \times (n-1)$ determinants all the way down to  $2 \times 2$  determinants.

This method of defining and evaluating det A is called Laplace's expansion along the first row. We can, in fact, use any row (or any column) to calculate  $\det A$ .

to calculate det A.

We often write det 
$$A = |A|$$
.

Example 2.16. Compute the determinant of cfix row)

$$A = \begin{bmatrix} 1 & 7 & 2 \\ 3 & 4 & 5 \\ \hline 6 & 0 & 9 \end{bmatrix}$$

The last row  $\overline{b} = 3$  and  $\overline{b}$ 

When we expand the determinant about any row or column, we must observe the following pattern of  $\pm$  signs (these correspond to the  $(-1)^{i+j}$  in  $C_{ij}$  check!).

This is best seen in an example.

column

Example 2.17. By expanding about the second row compute the determi-

4=(音音等)3×3

Example 2.18. Compute the determinant of

$$\int_{0}^{2\pi} |x|^{2} dx = \begin{bmatrix}
1 & 2 & 7 \\
0 & 0 & 3 \\
1 & 2 & 1
\end{bmatrix}$$

$$\det(A) = 0 + 0 + (4)^{2+3} (3) \begin{vmatrix} 1 & 2 \\ 1 & 2 \end{vmatrix}$$

$$= 0$$

### 2.7.1 Properties of determinants

- If we interchange two rows (or two columns) of A the resulting matrix has determinant equal to -det A.
- If we add a multiple of one row to another row (similarly for columns), the resulting matrix has determinant equal to det A.
- If we multiply a row or column of A by a scalar α, the resulting matrix has determinant equal to α(det A).
- If A has a row or column of zeros, then det A = 0.
- If two rows (or columns) of A are identical, then det A = 0.

For any fixed  $i=1,\ldots,n$  we have  $\det A=a_{i1}C_{i1}+a_{i2}C_{i2}+\cdots+a_{in}C_{in}$ .

For any fixed  $j=1,\ldots,n$  we have  $\det A=a_{1j}C_{1j}+a_{2j}C_{2j}+\cdots+a_{in}C_{in}$ .

**Determinant test:** An  $n \times n$  matrix A is invertible if and only if  $det(A) \neq 0$ .

## 2.7.2 Vector cross product using determinants

The rule for a vector cross product can be conveniently expressed as a determinant. Thus if  $\underline{v} = v_x \underline{i} + v_y \underline{j} + v_z \underline{k}$  and  $\underline{w} = w_x \underline{i} + w_y \underline{j} + w_z \underline{k}$  then

### 2.7.3 Cramer's rule

Recall that if a linear system  $A\underline{x} = \underline{b}$  has a unique solution, then  $\underline{x} = A^{-1}\underline{b}$  is this solution. If we substitute the formula for the inverse  $A^{-1}$  from the previous section (using det  $S_{ji}$ ) into the product  $A^{-1}\underline{b}$  we arrive at **Cramer's rule** for solving the linear system  $A\underline{x} = \underline{b}$ .

**Cramer's rule**: Let  $A\underline{x} = \underline{b}$  be a linear system with a unique solution. This means that A is a square matrix with non-zero determinant. Let  $A_i$  be the matrix that results from A by replacing the ith column of A by  $\underline{b}$ . Then

$$x_i = \frac{det A_i}{det A}$$

Examples of Cramer's rule will be given in tutorials.

# 2.8 Obtaining inverses using Gauss-Jordan elimination

The most efficient method for computing the inverse of a matrix is by **Gauss-Jordan elimination** which we have met earlier.

- ullet Use row-operations to reduce A to the identity matrix.
- Apply exactly the same row-operations to a matrix set initially to the identity.
- The final matrix is the inverse of A.

We usually record this process in a large augmented matrix.

[ALZ]

- Start with [A|I].
- $\bullet\,$  Apply row operations to obtain  $\left[I|A^{-1}\right]$
- Read off  $A^{-1}$ , the inverse of A.

3

Recall that some texts use the term *Gaussian elimination* to refer to reducing a matrix to its *echelon* form, and the term *Jordan elimination* to refer to reducing a matrix to its *reduced echelon* form. In this manner, the **Gauss-Jordan algorithm** can be described diagrammatically as follows:

$$[A|I] \xrightarrow{G} [U|*] \xrightarrow{J} [I|B]$$
 where  $B = A^{-1}$ .

In words, provided A has rank n:

- augment A by the identity matrix;
- perform the Gaussian algorithm to bring A to echelon form U and [A|I] to [U|\*];
- perform the Jordan algorithm to bring U to reduced echelon form I and [U|\*] to [I|B] (in other words use elementary row operations to make the pivots all 1s and to produce zeros above the pivots);
- then  $B = A^{-1}$ .

**Example 2.19.** Use the Gauss-Jordan algorithm to invert the following

$$\begin{array}{c} \text{matrix } A. \\ \begin{bmatrix} 1 & 1 & 3 & 1 & 0 & 0 \\ 0 & 2 & 1 & | & 0 & 1 & 0 \\ 0 & 4 & 0 & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 1 & 1 & 3 & 1 & 0 & 0 \\ 0 & 4 & 0 & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 & 1 & 0 \\ 0 & 4 & 0 & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 & 1 \\ 0 & 4 & 0 & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 & 1 \\ 0 & 2 & 1 & | & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 & 1 \\ 0 & 2 & 1 & | & 0 & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 & 1 \\ 0 & 2 & 1 & | & 0 \end{bmatrix} \\ \begin{bmatrix} 0 & 2 & 1 & | & 0 \\ 0 & 1 & 0 & | & 1 \end{bmatrix} \\ \begin{bmatrix} 0 & 1 & 0 & | & 1 & 2 \\ 0 & 2 & 1 & | & 1 \\ 0 & 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 0 & 1 & 0 & | & 1 & 2 & 3 \\ 0 & 2 & 1 & | & 1 \\ 0 & 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 2 & 1 & | & 1 & 1 \\ 0 & 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 1 & 0 & | & 1 & 2 \\ 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 1 & 0 & | & 1 & 2 \\ 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 & -2 \\ 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 & -2 \\ 0 & 1 & 2 & 3 & -2 \\ 0 & 1 & 2 & 3 & -2 \end{bmatrix} \\ \begin{bmatrix} 1 & 0 & 0 & | & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 & -2 \\ 0 & 1 & 2 &$$

# 2.8.1 Inverse - another method

Here is another way to compute the inverse of a matrix.

- Select the  $i^{th}$  row and  $j^{th}$  column of A.
- Compute  $(-1)^{i+j} \frac{\det S_{ij}}{\det A}$
- Store this entry at  $a_{ji}$  (row j and column i) in the inverse matrix.
- Repeat for all other entries in A.

That is, if

$$A = [ a_{ij} ]$$

then

$$A^{-1} = \frac{1}{\det A} \left[ (-1)^{i+j} \det S_{ji} \right]$$

This method works but it is rather tedious.
